NVIDIA Agent Policy Fabric

November 2026

OpenShell Deployments at NVIDIA

Deployment environments and agent use cases

Deployment environments

- Virtual machines personal cloud desktops
- Personal work devices: Mac, Ubuntu, Windows
- Kubernetes

Use cases

- Long-running agents
- Personal agents

NVIDIA

Agents Act Across Systems Governed by Separate Policies

Agents work across systems governed by different stakeholders, policies, and controls

Fragmented Policies

Spans across systems, runtimes, and interfaces. Different stakeholders and interpretations can create decision drift

Deployment-Specific Requirements

Default policies need to be adapted to each deployment’s tools, environment, and operating limits

Enterprise Policy Accountability

Agent actions must be traceable to the enterprise policy in effect at the time

NVIDIA

APF Connects Enterprise Policy to Runtime Controls

Governed enterprise policy, tailored to each deployment and traceable to agent actions.

Unified, Governed Policy Fabric

Establish a unified, governed source of enterprise policy while preserving authority and provenance

Right Policy for Each Deployment

Flexible policy authoring tailored to each deployment’s configuration and operating requirements

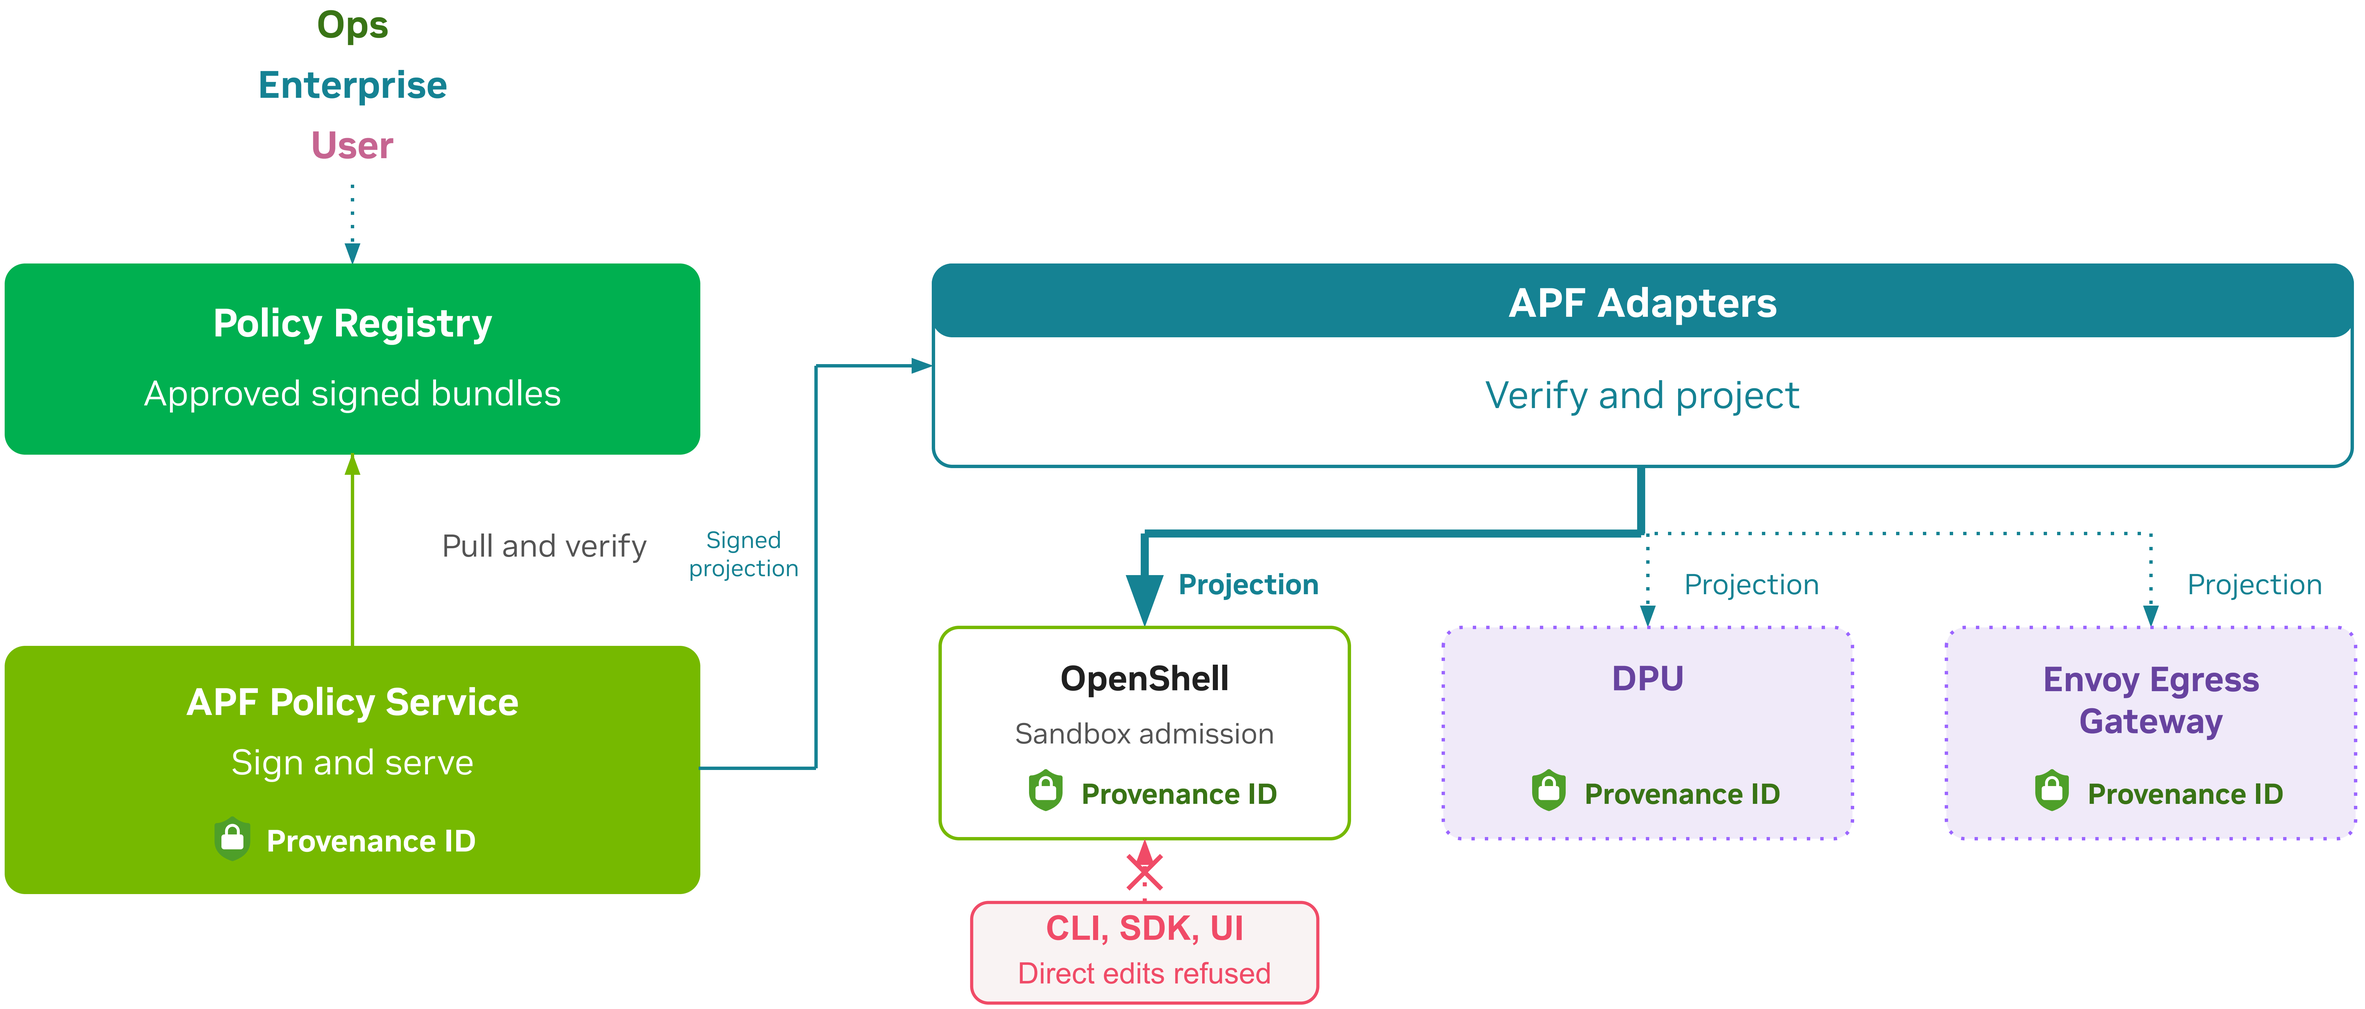

Verifiable Policy Attribution

Connect each governed action to the policy and evidence behind its authorization

NVIDIA

How APF Works

Approved signed policy projects to OpenShell, DOCA and the egress gateway
